## Dragon King: Rook + King

## $N+k$ Dragon Kings Problem

- $n+k$ dragon kings, $k$ pawns on $n \times n$ chessboard - no two dragon kings attack each other

## Existence of solutions

## Proposition

There is a solution when $k \geq 0$ and $n \geq k+5$.

## $n=k+5$

| 0 |  |  |  | $\square$ |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  | $\boxed{ }$ |  |  |  |
| $\square$ |  |  |  | 0 |  |
|  |  |  | $\boxed{0}$ |  | $\square$ |
| 0 | $\square$ |  | 0 | 0 |  |
|  |  |  |  | $\square$ |  |

## $n=k+5:$ continued

| 0 |  | 0 |  |  |
| :--- | :--- | :--- | :--- | :--- |
| 0 |  |  |  | 0 |
|  |  |  | 0 |  |
|  | 0 |  |  | 0 |
|  |  |  |  | 0 |
| 0 | 0 |  | 0 | 0 |

## $n \geq k+5$

## Proposition

There is a solution when $k \geq 12$ and $n \geq k$.

## Number of solutions

For $k=0$, see OEIS Sequence A002464.

| $n \backslash k$ | 0 | 1 | 2 | 3 | 4 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4 | 2 | 0 | 0 | 0 | 0 |
| 5 | 14 | 0 | 0 | 0 | 0 |
| 6 | 90 | 32 | 0 | 0 | 0 |
| 7 | 646 | 762 | 124 | 0 | 0 |
| 8 | 5242 | 14412 | 9056 | 1688 | 94 |
| 9 | 47622 | 250326 | 380776 | 216678 | 48374 |
| 10 | 479306 | 4252504 | 12538132 | 16006424 | 9629406 |

Number of $n+k$ dragon kings problem solutions for $4 \leq n \leq 10$ and $0 \leq k \leq 4$

## Symmetries

## Lemma

Each solution corresponds to an $n \times n$ alternating sign matrix with $k-1 s$ in which no two 1 's are adjacent.

$$
\left[\begin{array}{ccccccc}
0 & 0 & 0 & 1 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 1 & 0 \\
0 & 0 & 1 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 1 & 0 & 0 \\
0 & 1 & 0 & -1 & 0 & 0 & 1 \\
0 & 0 & 0 & 1 & 0 & 0 & 0 \\
1 & 0 & 0 & 0 & 0 & 0 & 0
\end{array}\right]
$$

## Symmetries

## Proposition

No solution (with $n>1$ ) is symmetric with respect to vertical or horizontal reflection.

## Corollary

We can partition the solution set into 5 symmetry classes.

## 1. Ordinary

NOT symmetric w.r.t. reflection or nontrivial rotation

## Proposition

These exist for $n \geq k+5$.

## 2. Centrosymmetric

Symmetric w.r.t. $180^{\circ}$ rotation, but not $90^{\circ}$ rotation or any reflection

## Proposition

If $k$ even, these exist for $n \geq 2 k+6$. If $n$ and $k$ odd, these exist for $n \geq 2 k+5$.

## 3. Doubly centrosymmetric

Symmetric w.r.t. $90^{\circ}$ rotation, but not any reflection

## Proposition

A doubly centrosymmetric solution exists if any of the following conditions hold:
(1) $n \equiv 0(\bmod 4), k \equiv 0(\bmod 4)$, and
$n \geq \max \{2 k, 4\}$
(2) $n \equiv 1(\bmod 4), k \equiv 0(\bmod 4)$, and
$n \geq \max \{2 k+1,5\}$
(3) $n \equiv 3(\bmod 4), k \equiv 1(\bmod 4)$, and
$n \geq \max \{2 k+1,11\}$

## 4. Monodiagonally symmetric

Symmetric w.r.t. reflection across either main diagonal or antidiagonal, but not both. Not symmetric w.r.t. rotation.

## Proposition

These exist for $n \geq 2 k+5$.

## 5. Bidiagonally symmetric

Symmetric w.r.t. reflection across both the main diagonal and antidiagonal. Also symmetric w.r.t. $180^{\circ}$ rotation, but not $90^{\circ}$ rotation.

## Proposition

A bidiagonally symmetric solution exists if

- $k$ even and $n \geq 2 k+6$, or
- $n$ and $k$ odd and $n \geq 2 k+5$

## Open problems

Many questions remain.

- How much can we tighten the bounds?
- How many solutions?
- What happens on other types of board (cylinder, torus, etc.)?
- What happens with different restrictions (e.g, not allowing pieces on adjacent squares)?
